

ECONOMIC BACKGROUND (Link Asset Services Commentary November 2021)

MPC meeting 4th November 2021

- The Monetary Policy Committee (MPC) voted 7-2 to leave Bank Rate unchanged at 0.10% with two members voting for an increase to 0.25% and made no changes to its programme of quantitative easing purchases due to finish by the end of this year at a total of £895bn by a vote of 6-3.
- After the Governor and other MPC members had made speeches prior to the MPC meeting in which they stressed concerns over inflation, (the Bank is now forecasting inflation to reach 5% in April when the next round of capped gas prices will go up), thus reinforcing the strong message from the September MPC meeting, financial markets had confidently built in an expectation that Bank Rate would go up from 0.10% to 0.25% at this meeting. However, these were not messages that the MPC would definitely increase Bank Rate at the first upcoming MPC meeting as no MPC member can commit the MPC to make that decision ahead of their discussions at the time. The MPC did comment, however, that Bank Rate would have to go up in the short term. It is, therefore, relatively evenly balanced as to whether Bank rate will be increased in December, February or May. Much will depend on how the statistical releases for the labour market after the end of furlough on 30th September 2021 turn out.
- Information available at the December MPC meeting will be helpful in forming a picture but not conclusive, so this could cause a delay until the February meeting. At the MPC's meeting in February it will only have available the employment figures for November: to get a clearer picture of employment trends, it would, therefore, need to wait until the May meeting (although it also meets in March) when it would have data up until February. At its May meeting, it will also have a clearer understanding of the likely peak of inflation expected around that time. If the statistics show the labour market coping well during the next six months, then it is likely there will be two increases in these three meetings.
- Over the next year the MPC will be doing a delicate balancing act of weighing combating inflation being higher for longer against growth being held back by significant headwinds. Those headwinds are due to supply shortages (pushing prices up and holding back production directly), labour shortages, surging fuel prices and tax increases. However, those headwinds could potentially be offset – at least partially - by consumers spending at least part of the £160bn+ of “excess savings” accumulated during the pandemic. However, it is also possible that more affluent people may be content to hold onto elevated savings and investments and, therefore, not support the economic recovery to the extent that the MPC may forecast.
- The latest forecasts by the Bank showed inflation under-shooting the 3 years ahead 2% target (1.95%), based on market expectations of Bank Rate hitting 1% in 2022. This implies that rates don't need to rise to market expectations of 1.0% by the end of next year.
- It is worth recalling that the MPC pointedly chose to reaffirm its commitment to the 2% inflation target in its statement after the MPC meeting in September yet at its August meeting it had emphasised a willingness to look through inflation overshooting the target for limited periods to ensure that inflation was ‘sustainably over 2%’. On balance, once this winter is over and world demand for gas reduces - so that gas prices and electricity prices fall back - and once supply shortages of other goods are addressed, the MPC is forecasting that inflation would return to just under the 2% target.
- **The MPC's forward guidance on its intended monetary policy** on raising Bank Rate versus selling (quantitative easing) holdings of bonds is as follows: -
 1. Raising Bank Rate as “the active instrument in most circumstances”.
 2. Raising Bank Rate to 0.50% before starting on reducing its holdings.
 3. Once Bank Rate is at 0.50% it would stop reinvesting maturing gilts.
 4. Once Bank Rate had risen to at least 1%, it would start selling its holdings.
- **COVID-19 vaccines.** These have been the game changer which have enormously boosted confidence that **life in the UK could largely return to normal during the summer** after a third wave of the virus threatened to overwhelm hospitals in the spring. With the household saving rate having been exceptionally high since the first lockdown in March 2020, there is plenty of pent-up demand and purchasing power stored up for services in hard hit sectors like restaurants, travel and hotels. The big question is whether mutations of the virus could develop which render current vaccines ineffective, as opposed to how quickly vaccines can be modified to deal with them and enhanced

testing programmes be implemented to contain their spread. There is also a potential for the winter flu season combined with Covid to overwhelm NHS hospitals so the UK is not entirely in the clear yet.

- **Since the September MPC meeting**, the economy has been impacted by rising gas and electricity prices which are now threatening to close down some energy intensive sectors of industry – which would then further impact the supply chain to the rest of the economy. Ports are also becoming increasingly clogged up with containers due to a shortage of lorry drivers to take them away. The labour market statistics for August released in mid-October showed a sharp rise in employment but also a continuing steep rise in vacancies. The combination of all these factors is a considerable headwind to a recovery of economic growth in the months ahead.

US. Shortages of goods and intermediate goods like semi-conductors, are fuelling increases in prices and reducing economic growth potential. It now also appears that there has been a sustained drop in the labour force which suggests the pandemic has had a longer-term scarring effect in reducing potential GDP. Economic growth may therefore be reduced to between 2 and 3% in 2022 and 2023 while core inflation is likely to remain elevated at around 3% in both years instead of declining back to the Fed's 2% central target. This could well cause the Fed to focus on supporting economic growth by delaying interest rate rises, rather than combating elevated inflation i.e., there may be no rate rises until 2023.

EU. The slow roll out of vaccines initially delayed economic recovery in early 2021 but the vaccination rate then picked up sharply. After a contraction of -0.3% in Q1, Q2 came in with strong growth of 2%. With Q3 at 2.2%, the EU recovery is nearly complete although countries dependent on tourism are lagging. Recent sharp increases in gas and electricity prices have increased overall inflationary pressures but the ECB is likely to see these as being only transitory after an initial burst through to around 4%, so is unlikely to be raising rates for a considerable time.

German general election. With the CDU/CSU and SPD both having won around 24-26% of the vote in the September general election, the composition of Germany's next coalition government may not be agreed by the end of 2021. An SPD-led coalition would probably pursue a slightly less restrictive fiscal policy, but any change of direction from a CDU/CSU led coalition government is likely to be small. However, with Angela Merkel standing down as Chancellor as soon as a coalition is formed, there will be a hole in overall EU leadership which will be difficult to fill.

China. After a concerted effort to get on top of the virus outbreak in Q1 2020, economic recovery was strong in the rest of the year; this enabled China to recover all the initial contraction. During 2020, policy makers both quashed the virus and implemented a programme of monetary and fiscal support that was particularly effective at stimulating short-term growth. At the same time, China's economy benefited from the shift towards online spending by consumers in developed markets. These factors helped to explain its comparative outperformance compared to western economies during 2020 and earlier in 2021. However, the pace of economic growth has now fallen back after this initial surge of recovery from the pandemic and China is now struggling to contain the spread of the Delta variant through sharp local lockdowns - which will also depress economic growth. There are also questions as to how effective Chinese vaccines are proving. Supply shortages, especially of coal for power generation, which is causing widespread power cuts to industry, are also having a sharp disruptive impact on the economy. In addition, recent regulatory actions motivated by a political agenda to channel activities into officially approved directions, are also likely to reduce the dynamism and long-term growth of the Chinese economy.

Japan. 2021 has been a patchy year in combating Covid. However, recent business surveys indicate that the economy is rebounding rapidly now that the bulk of the population is fully vaccinated and new virus cases have plunged. The Bank of Japan is continuing its very loose monetary policy but with little prospect of getting inflation back above 1% towards its target of 2%, any time soon: indeed, inflation was actually negative in July. New Prime Minister Kishida had promised a large fiscal stimulus package after the November general election which his party has now won.

World growth. World growth was in recession in 2020 but recovered during 2021 until starting to lose momentum more recently. Inflation has been rising due to increases in gas and electricity prices, shipping costs and supply shortages, although these should subside during 2022. It is likely that we are heading into a period where there will be a reversal of **world globalisation** and a decoupling of western countries from dependence on China to supply products, and vice versa. This is likely to reduce world growth rates from those in prior decades.

Supply shortages. The pandemic and extreme weather events, followed by a major surge in demand after lockdowns ended, have been highly disruptive of extended worldwide supply chains. At the current time there are major queues of ships unable to unload their goods at ports in New York, California and China. Such issues have led to a misdistribution of shipping containers around the world and have contributed to a huge increase in the cost of shipping. Combined with a shortage of semi-conductors, these issues have had a disruptive impact on production in many countries. The latest additional disruption has been a shortage of coal in China leading to power cuts focused primarily on producers (rather than consumers), i.e., this will further aggravate shortages in meeting demand for goods. Many western countries are also hitting up against a difficulty in filling job vacancies. It is expected that these issues will be gradually sorted out, but they are currently contributing to a spike upwards in inflation and shortages of materials and goods on shelves.
